12. **Objectives:** The main objective of retaining walls are to help prevent soil erosion, create usable beds out of steep terrain and to provide decorative or functional landscaping features. They may be independent structures, or may be part of a wider construction works, such as a building.
13. **Outcomes:** Students will be able to do the complete design and detailing of different types of retaining walls.
14. **Description (program conduction details) / speaker topic explanation:**
Rajgad Dnyanpeeth's Shri Chhatrapati College of Engineering Dhangwadi, Pune has conducted an expert lecture of “Design of L & T- shape Retaining wall” on 13th October 2020 B.E civil students to give information about “Design of L & T –Shaped Retaining wall ”. Retaining walls are usually built

to hold back soil mass. However, retaining walls can also be constructed for aesthetic landscaping purposes. Retaining walls are structures used to retain earth or other loose materials which would not be able to stand vertically by itself. The retaining material exerts a push on structure and this tends to overturn and slide it. The weight of the retaining walls is of considerable significance in achieving and maintaining stability of the entire system. The basic function of these walls is to provide lateral support for a mass of earth or other material that is at a higher elevation behind the wall than the earth or other material in front of the wall.

Conclusion: There are numerous approaches to design and many types of retaining systems, each with specialized applications that can be used to retain soil and/or provide stability to slopes. Understanding what is involved in each design approach, how the system is constructed, and under what conditions they are constructed is imperative to successful and economical design and construction
