SEMINAR REPORT

DEPARTMENT: E&TC

CLASS: TE & BE

NAME OF GUEST: Mr. B. S. Bhosale

TITLE/TOPIC: Arduino Based Automation

DATE: 01/08/2017

DURATION OF SESSION: 2 Hrs

STUDENT/ STAFF PRESENT: 71/4.

CO-ORDINATOR: Prof T. S. Zende

OBJECTIVE: The Main objective of this program to get introduce Arduino and understand simple functions of Arduino Uno Board namely LED blinking, LCD Display, Blinking LED using ADC (Potentiometer)

DESCRIPTION:

Arduino is an open-source hardware and software company, project and user community that designs and manufactures single-board microcontrollers and microcontroller kits for building digital devices and interactive objects that can sense and control objects in the physical and digital world. Arduino boards are available commercially in pre assembled form or as do-it-yourself (DIY) kits.

Arduino board designs use a variety of microprocessors and controllers. The boards are equipped with sets of digital and analog input/output (I/O) pins that may be interfaced to various expansion boards or breadboards and other circuits. The boards feature serial communications interfaces, including Universal Serial Bus (USB) on some models, which are also used for loading programs from personal computers. The microcontrollers are typically programmed using a dialect of features from the programming languages C and C++. In addition to using traditional compiler tool chains, the Arduino project provides an integrated development environment (IDE) based on the Processing language project.

The Arduino Uno has 14 digital input/output pins (of which 6 can be used as PWM outputs), 6 analog inputs, a 16 MHz crystal oscillator, a USB connection, a power jack, an ICSP header, and a reset button. It contains everything needed to support the microcontroller; simply connect it to a computer with a USB cable or power it with a AC-to-DC adapter or battery to get started. The Arduino Uno differs from all preceding boards in that it does not use the FTDI USB-to-serial driver chip. Instead, it features the Atmega8U2 microcontroller chip programmed as a USB-to-serial converter.

"Uno" means one in Italian and is named to mark the upcoming release of Arduino 1.0. The Arduino Uno and version 1.0 will be the reference versions of Arduino, moving forward. The Uno is the latest in

a series of USB Arduino boards, and the reference model for the Arduino platform. The Arduino open-sourced IDE drivers can be downloaded for free.

Features of the Arduino UNO:

- Microcontroller: ATmega328
- Operating Voltage: 5V
- Input Voltage (recommended): 7-12V
- Input Voltage (limits): 6-20V
- Digital I/O Pins: 14 (of which 6 provide PWM output)
- Analog Input Pins: 6
- DC Current per I/O Pin: 40 mA
- DC Current for 3.3V Pin: 50 mA
- Flash Memory: 32 KB of which 0.5 KB used by bootloader
- SRAM: 2 KB (ATmega328)
- EEPROM: 1 KB (ATmega328)
- Clock Speed: 16 MHz

CONCLUSION:

This seminar dealt in great detail about the performance of many mini projects that could be created by the students. After the workshop students understand the introduction about specifications of the board.

WORKSHOP REPORT

DEPARTMENT: **E&TC**

CLASS: **T.E. & B.E.**

NAME OF GUEST/EXPERT: **Mr. B. S. Bhosale**

FROM: **VCB Electronics, Khed Shivapur**

TITLE/TOPIC: **“Embedded Systems”**

DAY & DATE: **10th Sept 2015**

DURATION OF SESSION: **1 day**

STUDENT/ STAFF PRESENT: **77/5**

CO-ORDINATOR: **Prof. D. U. Dalavi**

OBJECTIVE: The main objective of the program was to impart in depth knowledge of application of Embedded System Design. The knowledge gained by the students from this workshop can be extremely helpful for their project selection and completion on embedded system

DESCRIPTION: Department of Electronics and telecommunication organized Workshop on **“Embedded Systems” on 10th Sept 2015** for TE and B.E. E&TC students to enhance their knowledge in industry. Embedded system is the core of every intelligent device. Everything around you from a simple watch to the space ship is using embedded systems. Your mobile phones, PDAs, Washing Machines, Microwave Ovens, Automobile and all the automated electronics gadgets are having one or another form of embedded systems responsible for their intelligent functioning. Electronic devices are rapidly finding applications in many of the areas, from simple coffee vending machines to space science to environmental friendly products such as big belly etc.

The architectural designs of CPU are RISC (Reduced instruction set computing) and CISC (Complex instruction set computing). CISC has the ability to execute addressing modes or

multi-step operations within one instruction set. It is the design of the CPU where one instruction performs many low-level operations.

A von Neumann architecture has only one bus which is used for both data transfers and instruction fetches, and therefore data transfers and instruction fetches must be scheduled - they can not be performed at the same time. It is possible to have two separate memory systems for a Harvard architecture

CONCLUSION: Students learned application of embedded system. Also they are able to understand the difference between the architectures. The workshop is helpful to select project topic and completion of projects.
